The sequence contained an oligo-dT track that was present in the cligonucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the NotI site and the oligo-dT track served to verify it as a clone from the non-normalized ovary at estrus day 12 library CDNA Library Preparation: RJ Woods, JA Green, RS Prather S142 Animal Science Missouri-Columbia, 65211 Clone distribution: Glones will be available through Research Genetics (www.resgen.com) The following repetitive elements were found in this cDNA sequence: 1-28, Seq primer: MI3 Forward

POLXA=Yes.

polylinker; Site_1: Not I; Site_2: BCO RI; The
NIH_BMAP_M.S3.2 library is a subtracted library of a
series, ultimately derived from a mixture of individually
tagged normalized libraries from ten regions of the mouse
brain (cerebellum, brain stems, olfectory bulbs,
hypothalamus, cortex, amygdala, basal ganglia, pineal
gland, striatum, hipoccampus) after a series of
subtractions to reduce the representation of cDNAs from
which ESTs had already been generated. The following
serially subtracted library (NIH_BMAP_M.S3.2) was constructed
as follows: PCRamplified cDNA inserts from NIH_BMAP_M.S2
clones from which 3' ESTs had been derived was used as a
driver in a hybridization with the NIH_BMAP_M.S2
in the form of single-stranded circles: The remaining
single-stranded collows: converted to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The Sequence contained an oligo-dT track that was present in the coligonucleotide that was used to prime the synthesis of first clignucleotide that was used to prime the synthesis of first strand cDNA and therefore this may represent a bonafide poly A tail. The sequence tag present in the cDNA between the Norls site and the oligo-dT track served to identify it as a clone from the normalized pineal glands library cDNA Library Preparation: M.B. Soares Lab Clone distribution: NH BMAP cDNA clones will be made available by the means for distribution of the BMAP cDNA clones, this record will be updated accordingly when that means is determined. BOUNA-Yes.

parvum (IOWA isolate) genomic DNA was hydrodynamically
sheared to produce fragments having a tight size
distribution between 2-4 kb by Dr. Yvonne Thorstenson of
the Stanford DNA Sequencing and Technology Center
(http://sequence-www.stanford.edu/group/techdev/shear.htm
). The randomly sheared gDNA was chromatographed on
Sephacryl S-400 to remove any small fragments and DNA
eluting in the void volume was subcloned into an ECOR
V-digested, alkaline phosphatase-treated pBlueScript ISK-) vector and transformed into E. coli strain XL2 Blue
MRF'. Recombinant clones from the first plating of the
Ilbrary were selected for sequence analysis using T3 and
T7 primers.

                                                                                                                                                                                                                                                                        sequence and CDNA sequence analysed (see AARB3309, AARB3436, AARD0524, AAT00525). Both the simian and the human ORFs encode a precursor Polypeptide (AARB3436, AARB3438). The precursor polypeptides each comprise a 48-AA leader sequence and a sequence encoding mature simian or human IL-15 polypeptides. The active simian and human IL-15 polypeptides are disclosed in AARB3309 & AARB3310 respectively. The invention also comprises other mammallan IL-15, including human IL-15, that hybridise to probes defined by AARB3438. A plasmid contg. a recombinant clone of human IL-15 CONA was deposited with ATCC on Feb. 19 1993 under ATCC 69245. The deposit was named 141-hETF. AARB3435 is a mammallan mature IL-15 polypeptide. It is a generic sequence which encompasses both AARB3309 (simian) and AARB3310 (human) IL-15 mature polypeptides.
                                                                                                                                                                        Isolated DNA encoding polypeptide with mammalian IL-15 activity - which stimulates proliferation and differentiation of T cells, used for treating carcinoma(s), melanomas, etc. and viral infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        300
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                61 CTAAACAGTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGT 120

                                                                                                                                                                                                                                        The simian ETF (epithelium derived T cell factor) was isolated from African green monkey CV1/EBNA cell conditioned medium. The Neterinal sequence of the purified SETF was determined and then PCR primers were designed based on the sequence information. A 92 bp primers were designed based on the sequence information. A 92 bp screen a CV1/EBNA cDNA inbrary for the full-length sETF coding sequence (i.e. the present sequence). Mature SETF induces proliferation and/or differentiation of precursor or mature T cells and is useful for promoting long-term in vitro culture of T-lymphocytes and T-cell lines. It is used for treating

This is the nucleotide sequence encoding a human epithelium-derived T-cell factor (ETF). The gene was obtained using a 1.37 kb fragment of the corresp. African green monkey gene (AAT42224) as a probe to screen a DNA ilbrary constructed from RNA derived from the IMTLH cell line. This cell line is derived by stable transformation of a human bone marrow stromal call culture with psylance. From a pool of about 1000 cDNA clones, one clone I41.hETF contained this sequence. ETF is a protein of proliferation and/or differentiation of precursor and/or mature T cells. The protein is therefore useful for promoting long term in vivo culture of T-lymphocytes and T-cell lines.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       300

Muteins of human IL-15 or simian IL-15 (see also AAR89526) are useful as antagonists of IL-15 and can be prepd. by PCR-mediated mutagenesis of the encoding sequences. Preferred muteins have amino acid substitutions at Asp56 and/or Gln156 of the IL-15 protein that prevent signal transduction. They are useful for treating graft-versus-host
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antagonists of interleukin-15 - are used to treat patients having symptoms of graft-versus-host disease and for prolonging allo:graft survival

These polypeptides have particular appliacation in the treatment of gastrointestinal disorders associated with disruption of the gastrointestinal epithelium or villi such as chemotherapy- and radiation-therapy induced enteritis (gut toxicity), mucositis, peptic ulcer disease, gastroenteritis and colitis, villus atrophic disorders, malignancy and inflammatory bowel disease. BTF polypeptides may also be useful in the treatment of human immunodeficiency virus (HTV) and HTV-associated disease due to their ability to stimulate CD4 and CD8+cells. Biologically active ETF may be used to treat a variety of other diseases or conditions where T-cell or B cell stimulation is desired.
                                                                                                                                              Epithelium derived T-cell factor; ETF; simian; gastrointestinal disease; B-cell stimulation; epithelium; villi; CD4+; CD8+; T-cell stimulation; treatment; prevention; ss.

```
The invention relates to an isolated antibody that binds specifically to a similan or human epithelium-derived T-cell factor (ETF) polypeptide. The antibodies are used, optionally when immobilized or labeled, to detect and quantify ETF in standard immunosisays. They may also be used as diagnostic and therapeutic agents, e.g. when conjugated to toxins (or their precursors) or radionuclides. ETF induces proliferation and/or differentiation of T cells (or their precursors), e.g. for use in establishing long term in vitro cultures; and is also used to treat gastrointestinal disease (e.g. entertitis or mucositis induced by chemotherapy or radiation, peptide ulcer, gastroenteritis, colitis, villus atrophy, malignancy and inflammatory bowel disease, or generally in any situation requiring stimulation of T or B cell proliferation, secretion of immunoglobulins or certain cytokines, increased anti-infectious disease immunity, induction of T-cell lytic activity or increased destruction of tumour or virus-infected cells. The presents a DNA encoding a simian ETF precursor
                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

sequence. The IL-15 nucleotide sequence and the protein encoded by it can be used to determine and create antagonists of IL-15. An antagonist of IL-15 can be used for treating an inflammatory bowel disease (IBD). The invention relates to the treatment of cellac disease using IL-15 antagonists. The antagonists are preferably muteins of IL-15, antibodies against IL-15 or IL-15 molecules bound to chemical groups that interfere with the ability of IL-15 to effect a signal transduction through either the alpha or the gamma subunit of the IL-15 receptor complex. The IL-15 antagonists of the invention can be used to treat irritable bow disease
                                                                                                                                                                                                                                                                                                                                           treating an inflammatory bowel

FF is a previously unidentified T-cell growth factor which stimulates precursor or mature CD4 and CD8+ T-lymphocytes to proliferate and differentiate. It also promotes proliferation of the gastrointestinal epithelium. The protein can be used to promote long-term in vitro culture of T-lymphocytes and T-cell lines. ETF can be used for treating HIV infection, HIV-associated diseases, and other diseases or conditions where stimulation of T-cell proliferation would be desirable e.g., it

could be used to augment the destruction of tumour cells or virally-
infected cells. ETF may also be used to treat or prevent gastrointestinal
disease, including chemotherapy and radiotherapy associated enteritis,
gastroenteritis, colitis, inflammatory bowel disease and villus atrophic
disorders. Chemotherapy and radiotherapy associated enteritis (gut
toxicity) results in bleeding and sepsis due to gastrointestinal flora
entering the blood, and thus can limit the dosage of therapeutic agent
administered to a cancer patient. ETF may therefore be used to increase
the tolerated doses radiotherapy and chemotherapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Human; interleukin 15; IL-15; gene therapy; chromosome 4q31; infection;

                         factor (ETF) polypeptides. Antibodies that specifically bind to the polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and the langamentory bowel disease; for increasing tolerated doses for radiation toxicity; and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The conditions where it is desired to stimulate proliferation of T-lymphocytes and B lymphocytes, or the secretion of immunoglobulin B lymphocytes, to augment anti-infectious disease immunity, to induce CTL, LAK Or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a cDNA
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CTAAACAGTCATTTTCTAACTGAAGCTGGCATTCATGTCTTCATTTTGGGCTGTTTCAGT 120

specifically cleaves mRNA encoding interleukin 15 (IL-15). The enzymatic RNA molecules can bind to and cleave mRNA encoding IL-15. The enzymatic RNA molecules can bind to and cleave mRNA encoding IL-15. They can be used for treating disorders associated with IL-15 such as inflammatory disorders, e.g. rheumatoid arthritis by inhibiting the synthesis of IL-15 in lymphocytes and preventing the recruitment and activation of macrophages. They can also be used to develop transgenic animals which can be used to identify the impact of increased or decreased IL-15 levels on a particular pathway or phenotype. The present sequence represents a human IL-15 DNA sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       556

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down regulate the expression and or activity of target polypeptides associated with ung/respiratory disorders and malignancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoquobulins and antibodies, antibody receptors, cytokines and activating peptide factors and transmitters, transcription factors, binding proteins, adheasion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creeptors, defensins, growth factors, vasociated proteins. The receptors, binding proteins and malignancy associated proteins. The antisense oligonucleotides may be used in this way to treat disorders including respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or bronchoconstriction) and/or surfactant hypoproduction which are associated with a disease of and/or surfactant hypoproduction which are associated with a disease of and/or surfactant hypoproduction, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (NR), pulmonary impeded respiration, pulmonary disease (COPD), pulmonary transplantation rejection, pulmonary infections, bronchitis,
                                                                                                                                                                                                                                                                                         Low adenosine antisense oligonucleotide, phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; surfactent depletuo; respiratory; bronchodilator; antiinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -
                                                                                                                                                                                                                                                  Human low adenosine antisense oligonucleotide related seguence #2909.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Disclosure; Page 1344-1345; 1592pp; English.

IL-15 is a member of (IL-15) by hybridising to IL-15 mRNA (AAAS8044). IL-15 is a member of The short chain, 4 alpha helix bundle cytokine family and is a potent T-cell growth factor and activator. IL-15 acts as a stimulator of various T-cell mediated pathological immune responses, such as autoimmune disorders (e.g., rheumatoid arthritis, graft versus host disease and organ transplant rejection), and has a proinflammatory role in rheumatoid arthritis synovitis. The antisease oligonucleotides are useful for inhibiting IL-15 production and are thus useful for alleviating inflammatory polyarthopathy associated with rheumatoid arthritis, organ transplant rejection (e.g., kidney transplant rejection, eell transplant rejections, asthma, lupus erythematosus and inflammatory bowel disease. The present sequence represents a CDNA copy for the contract of the contract o

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic, and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation. The Compositions are impaired airways, including lung disease and diseases whose secondary of fects affilict the lungs of a subject. They can be used for treating effects affilict the lungs of a subject. They can be used for treating esthma, impeded respiration, respiratory distress syndrome, pain, cystic plinosis, pulmonary hypertension, emphysema, chronic obstructive plinosary disease (COPD), and cancers such as leukaemias, lymphomas, cartinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine receptors causing broncheonstriction and inflammation. AAA32131 to AAA33213 represent the nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, but the sequences

This invention describes novel antisense oligonucleotides of 8-40 nucleic acids, targeted to interleukin-15 (IL-15). The products of the invention have anti-ILIA, anti-Inflammatory, hepatotropic, anti-arthritic, neuroprotective, antiproliferative and antiulcer activity and can be used for gene therapy. The antisense oligonucleotides are used to inhibit interleukin-15 (IL-15) expression and production, and prevent the recruitment and activation of macrophages. They are used to treat diseases associated with an increased expression of IL-15. Such diseases include inflammatory disorders, such as inflammatory bowel disease, arthritis, cirrhosis, multiple sclerosis, chronic liver disease, arthritis, cirrhosis, multiple sclerosis, chronic liver disease, in vivo or ex vivo. The antisense oligonucleotides of the invention are specific for interleukin-15 (IL-15), and can be delivered exogenously or can be expressed from DNA or RNA vectors. This sequence encodes

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'universal' or alternative base. (I) can have respiratory, bronchodiator, antiinflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with activity of target polypeptides associated with activity and paptide factors and malignancies, such as stimulating and activity and antibodies, antibody receptors, cytokines and activity produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors, central nervous system (CNS) and peripheral nervous and non-nervous system creeptors, denosine receptors, vascactive peptides and reasonable transmitters, defensins, growth factors, vascactive peptides and receptors, binding proteins and malignancy associated proteins. The alticulang respiratory obstruction (especially pulmonary obstruction and/or bronchoconstriction) and/or lung inflammation, allergy(ies) and/or surfactory hyporoduction which are associated with a disease or condition and or condition and condition and conditions and conditions and condition which are associated with a disease or condition.
                                                                                                                                                                                                                                     Low adenosine antisense oligonucleotide, phosphorothioate, allergy; human: airway disorder; bronchoconstriction; lung inflammation; surfactant depletion; respiratory; bronchodilator; antihinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; proposition; pronchitis; pulmon constructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            condition selected from pulmonary vasoconstriction, inflammation, allergies, asthma, impeded respiration, respiratory distress syndrome (RDS), pain, cystic fibrosis (CF), allergic rhinitis (AR), pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), pulmonary transplantation resjection, pulmonary infections, bronchitis, and/or cancer. AAF18434 to AAF21543 represent human polynucleotide
                                                                                                                                                                                       Human low adenosine antisense oligonucleotide related sequence #2912.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 1349-1353; 1592pp; English.

```
This DNA encodes a wild-type interleukin-15 (IL-15) polypeptide. This wild-type sequence can be mutated at codon positions 149 and 156 to create a mutant IL-15 polypeptide. The mutant polypeptide is at least of reate a mutant IL-15 polypeptide. The mutant polypeptide is at least one of the cellular events that normally occurs when wild-type IL-15 polypeptide is a threat specifically binds to a cell surface receptor. The mutant IL-15 is used for suppressing the immune response in a patient. It can be used for treating autoimmune diseases such as rheumatic arthritis, type I diabetes or a rheumatic disease selected from systemic lupus erythematosus (SLE), Siggren's syndrome, scleroderma, mixed connective tissue disease. Carmatomyositis, polymyositis, Reiter's syndrome and Behcet's disease. Carmatomyositis, polymyositis, Reiter's syndrome and Behcet's disease. Carmatomyositis, myasthenia gravis, encephalomyelitis, drave's disease. Carmitiple sclerosis, myasthenia gravis, encephalomyelitis, a variety of pemphigus, psoriasis, inflammatory bowel disease, AIDS and vascular calling a cell that expresses a IL-15 receptor. It can also be used to diagnose
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö

```

```
This DNA encodes a mutant interleukin-15 (IL-15) polypeptide. The wild-type IL-15 sequence was mutated at codon positions 149 and 156 to create this mutant IL-15 polypeptide. This mutant polypeptide is at least

90% identical to wild-type IL-15 and is capable of inhibiting at least one of the callular events that normally occurs when wild-type IL-15 pecifically binds to a cell surface receptor. The mutant IL-15 is used for suppressing the immune response in a patient. It can be used for treating autoimmune diseases such as rheumatic arthritis, type I diabetes or a rheumatic disease selected from systemic lupus erythematosus (SLE), Slogren's syndrome, scleroderma, mixed connective tissue disease, dermatomyositis, polymyositis, Reiter's syndrome and Behcet's disease. It can also be used to treat Hashimoto's thyroiditis, Grave's disease, multiple sclerosis, myasthenia gravis, encephalomyelitis, a variety of pemphigus, psoriasis, inflammatory bowel disease, AIDS and vascular injury. The mutant IL-15 can also be used for reducing the viability of a cell that expresses a IL-15 receptor. It can also be used to diagnose a disease treatable with an IL-15 antagonist.

targets nucleic acids involved in bronchoconstriction, allergies, and/or targets nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic.

Inflammation. The ON can have antiinflammatory, antiallergic.

Inflammation. The ON can have antiinflammatory, antiallergic.

Inflammation. The Cytostatic and analgesic activities. The compositions are useful for the treatment of diseases associated with inflammation, impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating e.g. ischaemic conditions, pulmonary vasoconstriction, allergies, asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive pulmonary disease (COPD), and cancers such as leukaemias, lymphomas, carcinomas, and cancers which may metastasise to the lungs, including the ONS reduces side effects. The A-containing ONS break down with the release of deoxyadenosine which activates adenosine receptors causing bronched and inflammation. AAA33311 to AAA35312 represent the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     nucleotide sequences given in the sequence listing from the present invention, which correspond to SEQ ID NO:1 to 2815, and then the last 185 sequences are also called SEQ ID NO:1 to 185, but the sequences differ from the previously named sequences. SEQ ID NO:11 to 1680 (AAA332323 to AAA33922) are specifically claimed ONs from the present invention. N.B. Sequences given in the disclosure of the present invention do not match up with their corresponding SEQ ID NO: sequences
                                                                                                                                                                                                                                                                                                                                                                                                        New antisense oligonucleotides useful for treating e.g. pulmonary vasoconstriction, inflammation, allergies, asthma, hypertension, bronchitis, emphysema, respiratory distress syndrome, ischemia or

The present invention describes low adenosine (A) content antisense oligonucleotides and compositions (I) comprising them. In the antisense oligonucleotides the A is replaced by a 'Universal' or alternative base. (I) can have respiratory, bronchodilator, antilnflammatory, analgesic, immunosuppressive, antiasthmatic, hypotensive and cytostatic activities. The antisense oligonucleotides and (I) can be used to down-regulate the expression and or activity of target polypeptides associated with ung/respiratory disorders and malliquancies, such as stimulating and activating peptide factors and transmitters, transcription factors, immunoglobulins and antibodies, antibody receptors, cytokines and chemokines, endogenously produced specific and non-specific enzymes, binding proteins, adhesion molecules and their receptors, cytokine and chemokine receptors, adenosine receptors, bradykinin receptors; central nervous system (CNS) and peripheral nervous and non-nervous system receptors, CNS and peripheral nervous and non-nervous system receptors, contral receptors, CNS and peripheral nervous and non-nervous system receptors, cannot receptors, cannot receptors and con-nervous system receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Low adenosine antisense oligonucleotide; phosphorothioate; allergy; human; airway disorder; bronchoconstriction; lung inflammation; burfactant depletion; respiratory; bronchodilator; antihinflammatory; immunosuppressive; antiasthmatic; analgesic; hypotensive; cytostatic; respiratory obstruction; pulmonary obstruction; impeded respiration; surfactant hypoproduction; pulmonary vasoconstriction; asthma; RDS; respiratory distress syndrome; pain; cystic fibrosis; allergic rhinitis; pulmonary hypertension; emphysema; pulmonary transplantation rejection; chronic obstructive pulmonary disease; pulmonary infection; bronchitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Low adenosine (A) content antisense oligonucleotides which do not trigger adenosine receptors during metabolism, useful e.g. for treating cancers and respiratory obstructions -

The present invention describes a new composition comprising an antisense oligonucleotide (ON) with low adenosine (up to 15%), which antisense oligonucleotide (ON) with low adenosine (up to 15%), which cargies nucleic acids involved in bronchoconstriction, allergies, and/or inflammation. The ON can have antiinflammatory, antiallergic.

Cusful for the treatment of diseases associated with inflammation, antiasthmatic, cytostatic and analgesic activities. The compositions are impaired airways, including lung disease and diseases whose secondary effects afflict the lungs of a subject. They can be used for treating cf. inclammation, impeded respiration, respiratory distress syndrome, pain, cystic asthma, impeded respiration, respiratory distress syndrome, pain, cystic fibrosis, pulmonary hypertension, emphysema, chronic obstructive carcinomas, and cancers which may metastasise to the lungs, including breast and prostate cancer. The reduction of the adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine content of the ONs reduces side effects. The A-containing ONs break down with the release of deoxyadenosine which activates adenosine creceptors causing conchoconstruction and inflammation. AAA33313 to AAA35312 represent throughtine sequences given in the sequences Isting from the present invention, which correspond to SEQ ID NO:11 to 185, but the sequences of differ from the previously named sequences. B CTL,

```
T-lymphocytes and B lymphocytes, or the secretion of immunoglobulin B lymphocytes, to augment anti-infectious disease immunity, to induce CTL, take or NK lytic activity, or to augment the destruction of tumour cells or cells infected with virus. The present sequence represents a cDNA or NR lymphocytes and the present sequence represents a cDNA or cells infected with virus.
                                                    encoding the simian ETF (SETF) mature polypeptide.

Antibodies that specifically bind to the ETF polypeptides are used for treating or preventing gastrointestinal diseases, such as chemotherapy and radiation therapy-induced enteritis and mucositis, peptic ulcer disease, villus atrophic disorders and inflammatory bowel disease; for increasing tolerated doses for radiation therapy and chemotherapy agents which are limited by gastrointestinal toxicity; and for treating HIV and HIV-associated diseases. The antibodies are further used to treat a variety of other diseases or conditions where it is desired to stimulate proliferation of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New antibodies that specifically binds epithelium-derived T-cell factor polypeptide useful for e.g. treating or preventing gastrointestinal diseases, HIV and HIV-associated diseases, augmenting destruction of
